What is Self-Measured Blood Pressure Monitoring (SMBP)?

Self-Measured Blood Pressure Monitoring is the regular measurement of blood pressure by a patient at home or elsewhere outside of the clinical setting using a personal home measurement device.

Summary of the Evidence Supporting Self-Monitoring

BLOOD PRESSURE TRACKER

SELF-MEASURED BLOOD PRESSURE MONITORING (SMBP)

What is Self-Measured Blood Pressure Monitoring (SMBP)?

Self-Measured Blood Pressure Monitoring is the regular measurement of blood pressure by a patient at home or elsewhere outside of the clinical setting using a personal home measurement device.

Why Implement an SMBP Program in Your Practice?

Burden of the disease

Health care payments for self-monitoring have far less revenue than the care provided at the clinic, which is expected for self-measured blood pressure monitoring.

Currently, reimbursement for SMBP varies by health care payer for both blood pressure monitors and the service of monitoring blood pressure.

Some medical practices loan monitors to patients or offer group purchasing programs for monitors and devices.

How to Successfully Implement an SMBP Program in Your Practice

THE PROOF:

79% hypertension control rate

After implementing digital cuffs, real-time alerts for abnormal readings, monitoring patient compliance with repeating abnormal measurements and targeting interventions during and between visits, Principal Investigator Dr. Larry Garber was able to raise hypertension control rates from 69% to 79% among 200,000 patients. This is well above the 90th percentile rank for the U.S.

Improve Your Patients’ Health:

CDC REPORT: “SELF-MEASURED BLOOD PRESSURE MONITORING: ACTION STEPS FOR CLINICIANS”

Be sure to read this very worthwhile report to learn more about how self-measured blood pressure monitoring can effectively improve your patients’ health.
